TITLE OF THE INVENTION

HYDROXYBENZYLAMINOBENZENES AS ANTI-INFLAMMATORY AGENTS

BACKGROUND OF THE INVENTION

5 The present invention relates to novel hydroxybenzylaminobenzenes useful as topical anti-inflammatory agents. We have found that the novel compounds are active in both the peritoneal macrophage assay and the U.V. erythema assay for
10 topical anti-inflammatory agents. However, these compounds are rapidly inactivated in vivo and devoid of any systemic effects.

Recent studies demonstrated that macrophages participate in the development and progression of
15 chronic inflammatory diseases such as rheumatoid arthritis. During the progression of inflammatory conditions, there is generally an appearance and/or presence of macrophages and lymphocytes, especially macrophages and polymorphonuclear leukocytes.
20 Macrophages are known to secrete various products in response to inflammatory stimuli. For example:

1) Neutral proteinases - the destructive peptide bond cleaving enzyme which has been shown to be directly involved in rheumatoid cartilage destruction; and

5 2) Prostaglandins (PG) (e.g., E_2 and I_2 by mouse peritoneal macrophages) and other arachidonic acid derivatives derived from both the cyclooxygenase and the lipoxygenase pathways.

10 These arachidonic acid oxygenation products have been identified as the critical mediators of various acute inflammatory conditions.

15 Accordingly, pharmacological agents which are capable of inhibiting the formation, the release, or the function of macrophages may also be effective agents in the treatment of rheumatoid arthritis, emphysema, bronchial inflammation, osteoarthritis, psonasis, acute respiratory distress syndrome, spondylitis, lupus, gout and other inflammatory diseases.

20 With respect to the U.V. erythema assay, it has been shown previously that the U.V. erythema condition is partially the result of a local release of prostaglandins derived oxidatively from arachidonic acid by the action of PG synthetases, e.g., cyclooxygenase and lipoxygenase. Therefore, pharmacological agents which inhibit the erythema are generally considered to be active topical anti-inflammatory agents.

25 30 Furthermore, anti-inflammatory agents which are not systemically active are advantageous in the sense that they are not subject to the adverse

effects, e.g., gastrointestinal ulcerations and bleeding that often plagued users of systemic NSAIA's (non-steroidal anti-inflammatory agents). Accordingly, an object of this invention is to provide 5 novel hydroxybenzylaminobenzenes as topical anti-inflammatory agents useful in the treatment of dermal inflammatory conditions and pruritus such as sunburn, erythema, eczema, contact dermatitis, and allergic dermatitis, and psoriasis.

10 Another object of this invention is to provide appropriate processes for the preparation of the subject novel compounds.

15 Still a further object of the present invention is to provide a pharmaceutically acceptable composition containing an effective amount of the active compound for the treatment of various dermatological inflammatory conditions.

20 Finally, it is the ultimate object of this invention to develop a method of treating dermal inflammation via the administration of an effective amount of the novel compounds as well as a pharmaceutically acceptable composition thereof to a mammalian species in need of such treatment.

25 DETAILED DESCRIPTION OF THE INVENTION

This invention relates to novel derivatives of hydroxybenzylamine of the structural formula (I):

or a pharmaceutically acceptable salt thereof.

Wherein R is

- (a) hydrogen;
- (b) halo especially fluoro, chloro or bromo;
- 5 (c) loweralkoxy especially C_{1-6} alkoxy, e.g., methoxy, ethoxy, isopropoxy, t-butoxy or cyclohexyloxy;
- (d) lower alkylthio especially C_{1-6} alkylthio, e.g., methylthio, ethylthio or cyclohexylthio;
- 10 (e) lower alkyl sulfinyl especially C_{1-6} alkyl sulfinyl, e.g., methyl sulfinyl, i-propyl sulfinyl, and cyclopentyl sulfinyl.
- (f) lower alkyl sulfonyl especially C_{1-6} alkyl sulfonyl such as methyl sulfonyl, ethyl sulfonyl and n-butyl sulfonyl;
- 15 (g) unsubstituted or substituted phenyl loweralkoxy such as benzyloxy;
- (h) loweralkyl especially C_{1-6} alkyl such as methyl, ethyl, propyl, t-butyl, pentyl, benzyl, cyclopropyl, cyclopentyl or cyclohexyl;
- 20 (i) loweralkenyl especially C_{2-6} alkenyl, for example, vinyl, allyl, and buten-2-yl.
- (j) acetoxy;
- 25 (k) $-O-CH_2-O-$;
- (l) $-COOH$;
- (m) aryl especially phenyl or substituted phenyl, e.g., 4-methoxyphenol, 2,4-difluorophenyl or 3-chlorophenyl; or
- 30 (n) aryloxy especially phenoxy;

R¹ is

(a) unsubstituted or substituted phenyl especially phenyl, 3-aminophenyl, 4-(3,3-dimethylbutyryl amino)phenyl, 5 3-methylphenyl, 3,5-dimethoxyphenyl, 3-ethylthiophenyl, 4-chlorophenyl, 4-trifluoromethylphenyl, 2,4-difluorophenyl, 10 4-nitrophenyl or the like;

(b) unsubstituted or substituted heteroaryl especially monoheteroaryl such as thiadiazolyl, pyrryl, pyridyl or pyrazinyl, imidazolyl, thiaimidazolyl, quinolino or 15 tetrazolyl or the like. The heteroaryl can be substituted with one or more of C₁₋₆ alkyl, C₁₋₆ alkoxy, C₁₋₆ alkylthio, halo especially chloro or fluoro, or the like; and

n is 1 to 5.

In a preferred embodiment of this invention,

R is

20 (a) hydrogen;

(b) loweralkoxy;

(c) lower alkylthio;

(d) halo; or

(e) loweralkyl;

25 R¹ is unsubstituted or substituted phenyl; and n is 1 to 3.

In the most preferred embodiment of this invention,

R is

30 (a) hydrogen;

(b) C₁₋₃ alkoxy such as methoxy, ethoxy or isopropoxy; or

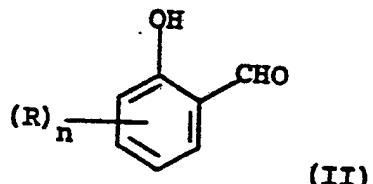

(c) C₁₋₃ alkylthio such as methylthio, ethylthio or propylthio;

R^1 is unsubstituted or substituted phenyl; and
n is 1 to 3.

The novel compounds of the present invention
are prepared from a process comprising:

5 Step (1): treating an appropriately substituted
2-hydroxy-benzaldehyde of the structural
formula (II)

10

with an amine of formula $R^1\text{NH}_2$ to form
a Schiff-base; and

15 Step (2): treating the resulting Schiff-base with a
reducing agent such as hydrogen in the
presence of a catalyst, e.g., Pd/C or
sodium tetrahydroboron.

In Step (1), the Schiff-base formation is
well-documented. See M. M. Sprung, Chem. Rev., 26,
20 297 (1940); R. W. Layer, Chem. Rev., 63, 489 (1963);
and G. Hilgetag and A. Martini, Preparative Organic
Chemistry, Wiley-Interscience, pp. 504-508 (1968).
Generally, the benzaldehyde is treated with neat
amine or a solution thereof at relatively low
25 temperatures, e.g., from about 0°C to about 25°C with
adequate stirring until the reaction is substantially
complete. The solution of the amine is usually
prepared by dissolving the amine in an organic
solvent preferably water, lower alcohol such as
30 methanol, ethanol, isopropyl alcohol or an aqueous
solution thereof. Under optimum conditions the
reaction usually takes from about 1 to about 24 hours.

In most cases, Step (2) can be conveniently merged into Step (1) by the simple addition of a reducing agent to the reaction mixture of step (1). The crude Schiff-base in the reaction mixture is thus 5 reduced in situ to the desired hydroxybenzylamino derivatives of formula (I).

The most commonly used reducing agents, among others, are hydrogen in the presence of Pd/C and sodium borohydride. Other metal hydrides, for 10 example, lithium borohydride, lithium aluminumhydride NaCnBH_3 and other substituted aluminum or borohydrides may also be used. See H. O. House, Modern Synthetic Reactions, 2nd ed., W. A. Benjamin, Inc., 1972, pp. 45-54.

15 The reduction is usually conducted at relatively low temperatures, e.g., from about 0°C to about 30°C, preferably below 25°C. A solvent is usually required. The commonly used solvents for each reducing agent are summarized below in Table I.

20

TABLE I

	<u>Reducing Agent</u>	<u>Useful reaction solvents</u>
25	NaBH_4	H_2O , CH_3OH , EtOH , i- PrOH , diglyme
	LiBH_4	Tetrahydrofuran, diglyme
30	LiAlH_4	Diethylether, tetrahydrofuran, 1,2-dimethoxyethane, and diglyme
	$\text{H}_2/\text{Pd/C}$	Ethylacetate, ethanol, water, acetic acid

Usually the reauction is substantially complete within from about 1 hour to about 48 hours. However, under optimum conditions, the reaction may take only 1 to 6 hours.

5 The starting materials in the preparation of the novel hydroxybenzylamine derivatives are mostly commercially available or can be easily prepared via conventional methods, for example, 4-(3,3-dimethylbutyrylamino)aniline is simply derived from the

10 reaction between 4-nitro-aniline and 3,3-dimethylbutyryl chloride followed by hydrogenation.

As the novel compounds of this invention are organic bases, their pharmaceutically acceptable salts are those resulting from the neutralization of

15 the base with an acid. The acid employed is usually an inorganic acid such as a hydrohalic acid, e.g., hydrochloric or hydrobromic acid; sulfuric acid; nitric acid; or phosphoric acid. An organic acid such as maleic, fumaric, tartaric, citric, acetic,

20 salicyclic, succinic, benzoic, benzenesulfonic, glutamic, lactic or isethionic acid is also commonly used. Generally the neutralization is conducted in an inert solvent such as water; a C₁₋₃ alkanol such as methanol, ethanol or isopropanol; a C₃₋₆-ketone

25 such as acetone, or ethylmethyl ketone; an ethereal solvent such as diethyl ether, tetrahydrofuran or dioxane; acetonitrile; or an aromatic solvent such as toluene. Mixtures of the above described solvents are also employed. Generally the neutralization is

30 carried out in aqueous ethanol, at 0°-75°C,

preferably at 0°-25°C, followed by filtration to collect the salts.

This invention also relates to a method of treating topical inflammation in patients in need of such treatment. Generally, a sufficient amount of a compound of formula (I) or a pharmaceutical composition thereof, particularly an especially preferred compound, is administered to the patient as the active constituent.

The U.V. erythema assay by which topical anti-inflammatory activity is determined, is based on the ability of the compounds of Formula I to inhibit the erythema induced on the skin of guinea pigs by UV radiation. It has been substantiated by recent studies that prostaglandin synthesis and the release thereof may be the primary process involved in the production of erythema. A protocol of the assay and some results thereof are summarized below in table II.

TABLE II

U.V. Erythema AssayProcedure

Guinea pigs were depilated and stabilized for 30 minutes. Following anesthesia with Nembutal (35 mg/kg), they were exposed to a U.V. lamp for 45 minutes at a distance of seven inches from the abdominal surface. Compound was applied topically (seven applications in a total of 0.1 ml vehicle) 15 minutes post exposure. The surface was then gently washed and read two hours post treatment.

Erythema Scoring

5	Numerical		<u>Description</u>
	<u>Designation</u>	<u>Score</u>	
	Negative	0	No erythema (normal skin color)
	Trace	+ 1	Faint pink in some areas
10	Slight	+ 2	Faint pink over entire site
	Slight-		
	Moderate	+ 3	Faint pink to red
	Moderate	+ 4	Red
	Marked	+ 5	Red to purplish red

15

Evaluation of Erythema

A numerical value 0-5 was assigned to the degree of erythema observed under standard lighting conditions. Drug effect on the developing erythema was calculated
20 as follows:

$$\% \text{ suppression} = \frac{\left(\frac{\text{score of vehicle}}{\text{treated}} \right) - \left(\frac{\text{Score of drug}}{\text{Treated}} \right)}{\text{score of vehicle treated}} \times 100$$

25

Results: % Inhibition of Erythema by N-(2-hydroxy-5-methoxybenzyl)aniline

30

- 11 -

16654

Dosage (mg)	% Inhibition (mean of 3 animals)				
	2 Hr.	3 Hr.	4 Hr.	6 Hr.	24 Hr.
5	0.1	19.3	16.7	15.0	6.7
	0.3	55.3	50.0	46.7	35.0
	1.0	80.3	91.7	76.7	63.3
	3.0	100	100	63.3	43.3

For treatment of inflammation, fever or
10 pain, the compounds of the invention are administered
topically, by inhalation spray or rectally in dosage
unit formulations containing conventional non-toxic
pharmaceutically acceptable carriers, adjuvants and
vehicles. In addition to the treatment of
15 warm-blooded animals such as mice, rats, horses,
dogs, cats, etc., the compounds of the invention are
effective in the treatment of humans.

The pharmaceutical compositions containing
the active ingredient may be in a form suitable for
20 topical use, for example, aqueous or oily solutions
or suspensions, dispersible powders or granules,
tinctures, topical aerosol emulsions, creams,
ointments, jellies, suppositories or the like.
Compositions intended for topical use may be prepared
25 according to any method known to the art for the
manufacture of pharmaceutical compositions
and such compositions may contain one or more active
compounds.

Aqueous suspensions contain the active
30 materials in admixture with excipients suitable for
the manufacture of aqueous suspensions. Such

excipients are suspending agents, for example sodium carboxymethylcellulose, methylcellulose, hydroxypropylmethylcellulose, sodium alginate, polyvinylpyrrolidone, gum tragacanth and gum acacia; dispersing or 5 wetting agents may be a naturally-occurring phosphatide, for example lecithin, or condensation products of an alkylene oxide with fatty acids, for example polyoxyethylene stearate, or condensation products of ethylene oxide with long chain aliphatic alcohols, 10 for example heptadecaethyleneoxycetanol, or condensation products of ethylene oxide with partial esters derived from fatty acids and a hexitol such as polyoxyethylene sorbitol monooleate, or condensation products of ethylene oxide with partial esters 15 derived from fatty acids and hexitol anhydrides, for example polyoxyethylene sorbitan monooleate. The said aqueous suspensions may also contain one or more preservatives, for example, ethyl, or n-propyl p-hydroxybenzoate.

20 Oily suspension may be formulated by suspending the active ingredient in a vegetable oil, for example, arachis oil, olive oil, sesame oil or coconut oil, or in a mineral oil such as liquid paraffin. The oily suspensions may contain a 25 thickening agent, for example, beeswax, hard paraffin or cetyl alcohol. These compositions may be preserved by the addition of an antioxidant such as ascorbic acid.

30 Dispersible powders and granules suitable for preparation of an aqueous suspension by the

addition of water provide the active ingredient in admixture with a dispersing or wetting agent, suspending agent and one or more preservatives.

5 Suitable dispersing or wetting agents and suspending agents are exemplified by those already mentioned above.

The pharmaceutical compositions of the invention may also be in the form of oil-in-water emulsions. The oily phase may be a vegetable oil, 10 for example, olive oil or arachis oils, or a mineral oil, for example, liquid paraffin or mixtures of these. Suitable emulsifying agents may be naturally-occurring gums, for example, gum acacia or gum tragacanth, naturally-occurring phosphatides, for 15 example, soy bean, lecithin, and esters or partial esters derived from fatty acids and hexitol anhydrides, for example, sorbitan mono-oleate, and condensation products of the said partial esters with ethylene oxide, for example, polyoxyethylene sorbitan 20 monooleate.

An ointment containing the pharmaceutical compositions of the present invention may be prepared, among other methods known in the art, by combining the active ingredient with a medium 25 consisting of a glycol, a lower alkanol; and water; a gelling agent; and optionally an adjuvant such as diisopropyl adipate, diethyl sebacate, ethyl carproate and ethyl laurate. Suitable glycols include propylene glycol, butylene glycol, 30 polyethylene glycol and the like. Generally, a

carboxyvinyl polymer preneutralized with an organic amine such as diisopropyl amine and triethylamine, or a cellulose, e.g., hydroxyethyl cellulose, methyl cellulose, carboxymethyl cellulose, hydroxypropyl cellulose, is used as the gelling agent.

The compounds of the invention may also be administered in the form of suppositories for rectal administration of the drug. These compositions can be prepared by mixing the drug with a suitable 10 non-irritating excipient which is solid at ordinary temperatures but liquid at the rectal temperature and will therefore melt in the rectum to release the drug. Such materials are cocoa butter and polyethylene glycols.

15 Dosage levels of the order to 0.2 mg to 140 mg per kilogram of body weight per day are useful in the treatment of the above-indicated conditions (10 mg to 7 gms per patient per day). For example, inflammation is effectively treated by the 20 administration from about 0.5 to 50 mg of the compound per kilogram of body weight per day (25 mg to 5 gms per patient per day). Advantageously, from about 2 mg to about 20 mg per kilogram of body weight per daily dosage produces highly effective results 25 (50 mg to 1 gm per patient per day).

The amount of active ingredient that may be combined with the carrier materials to produce a single dosage form will vary depending upon the host treated and the particular mode of administration.

30 Dosage unit forms will generally contain between from

about 25 mg to about 1 g of active ingredient.

It will be understood, however, that the specific dose level for any particular patient will depend upon a variety of factors including the 5 activity of the specific compound employed, the age, body weight, general health, sex, diet, time of administration, route of administration, rate of excretion, drug combination and the severity of the particular disease undergoing therapy.

10

EXAMPLE 1

4-(2-hydroxy-5-methoxybenzlamino)-3,3-dimethylbutyryl-aminobenzene

15 Step A: Preparation of (3,3-dimethylbutyryl-amino)aniline

Five grams of 4-nitroaniline was stirred in 25 ml of pyridine and 4.95 g of 3,3-dimethylbutyryl chloride was added. The mixture was stirred 15 hours and poured into ice-water. The resultant solid was 20 collected on a filter and dissolved in 200 ml of ethyl acetate and the column was treated with activated charcoal and concentrated to yield 6.3 g of 4-nitro-3,3-dimethylbutyrylaminobenzene, m.p. 192-194°. This material was reduced in 200 ml of 25 methanol, at 3 atmospheres of hydrogen in the presence of 5% Pd/carbon. After removal of the catalyst by filtration, concentration of the filtrate gives 5.3 g of product (3,3-dimethylbutyrylaminino)-aniline, m.p. 138-140°C.

30

Step B: Preparation of 4-(2-hydroxy-5-methoxybenzylamino)-3,3-dimethylbutyrylamino benzene

A mixture of 2.5 g of 3,3-dimethylbutyryl-aminoaniline and 1.84 g of 2-hydroxy-5-methoxybenzaldehyde was stirred in 50 ml of methanol, under a nitrogen atmosphere, for 15 hours. The mixture was then refluxed until tlc indicates that most of the starting material had reacted. After cooling, 0.50 g of NaBH_4 was added in two batches, and the mixture was stirred 2.5 hours. After concentration 6.9 g of solid was collected which was triturated with 100 ml of water and enough 2.5N HCl to neutralize the supernatant. 3.95 g of crude product was collected and purified by treatment with activated charcoal and recrystallization from ethyl acetate to give 2.5 g of 4-(2-hydroxy-5-methoxybenzylamino)-3,3-dimethylbutyrylamino benzene, m.p. 126-129°C.

Following substantially the same procedure as described above but substituting for the starting materials used therein 5-(t-butyl)-2-hydroxy-3-iodobenzaldehyde and 4-acetaminoaniline, there was prepared 4-(5-t-butyl-2-hydroxy-3-iodobenzylamino)acetanilide. M.p. 134.5-136°C.

25

EXAMPLE 2

3-(3,5-Dichloro-2-Hydroxybenzylamino)[1,2,5]thiadiazole

A mixture of 6.9 g of 3,5-dichloro-2-hydroxybenzaldehyde and 3-amino[1,2,5]thiazole hydrochloride was heated at 80° for 18 hours. After

cooling, 6.9 g of precipitate, m.p. 174-175° was collected. This precipitate was added to 100 ml of methanol and the mixture was cooled in an ice-bath before 1.4 g of NaBH_4 is added. The mixture was 5 stirred 1/2 hour and concentrated to give 9.0 g of solid which was purified by trituration with water and enough 2.5N HCl to give a neutral supernatant. The insolubles were then collected, heated with charcoal and recrystallized from methylene chloride 10 to give 5.1 g of 3-(3,5-dichloro-2-hydroxybenzyl-amino)[1,2,5]thiadiazole. M.p. 131-132°C.

EXAMPLE 3

N-(2-Hydroxybenzyl)Aniline

15 A mixture of 6.1 g of salicylaldehyde, 4.7 g of aniline and 50 ml of methanol was stirred and heated at 80° for 17 hours, cooled to 25° and 2.0 g of sodium borohydride was added in two batches. The mixture was stirred for 1 hour and the resultant 20 precipitate was collected on a filter. This solid was treated with activated charcoal and recrystallized from 150 ml of isopropanol to give 5.4 g of N-(2-hydroxybenzyl)aniline. M.p. 110-111°C.

25

EXAMPLE 4

N-(2-Hydroxy-5-Methoxybenzyl)Aniline

25 A mixture of 15.2 g 2-hydroxy-5-methoxy benzaldehyde, 93 g of aniline and 100 ml of methanol was stirred at 25° for 20 hours. The mixture was 30 then cooled with an ice-bath and stirred, and 3.9 g

of sodium borohydride was added slowly. The mixture was stirred for 1 hour at 25°, 150 ml of water was added and the pH was adjusted to 7.0 with 2.5N hydrochloric acid. The resultant solid was 5 collected, washed with water and purified by chromatography on silica gel using 3:17 ethyl acetate: n-hexane as an eluant. A 17.7 g yield of N-(2-hydroxy-5-methoxybenzyl)aniline was obtained. M.p. 82-84°.

10

EXAMPLE 5N-(2-Hydroxy-5-methoxybenzyl)Aniline

A mixture of 15.2 g of 2-hydroxy-5-methoxybenzaldehyde, 15 g of aniline and 200 ml of methanol 15 was stirred for 3 hours. The mixture was then hydrogenated at 40 psi in the presence of 2.0 g of 10% Pd/C until 0.1 mole of hydrogen was consumed. The catalyst was removed by filtration and the filtrate was concentrated in vacuo to a yellow oil which was 20 crystallized from ether-n-hexane to yield 18 g of N-(2-hydroxy-5-methoxybenzyl)aniline. M.p. 82.5-83°C.

Following substantially the same procedure as described above, but substituting for aniline used 25 therein the following compounds:

- (1) 2,6-dichloroaniline
- (2) 3,5-dimethylaniline
- (3) 3,5-dimethoxyaniline
- (4) 4-trifluoromethylaniline

30

There are obtained the following corresponding hydroxybenzylaminobenzene derivatives:

5 (1) 2,6-dichloro-N-(2-hydroxy-5-methoxybenzyl)-aniline, m.p.
(2) 3,5-dimethyl-N-(2-hydroxy-5-methoxybenzyl)-aniline
(3) 3,5-dimethoxy-N-(2-hydroxy-5-methoxybenzyl)-aniline
(4) 4-trifluoromethylaniline

10

EXAMPLE 6

Following substantially the same procedure as described in Example 5, but substituting for aniline used therein the following heterocyclic amines:

15 (1) 3-aminoquinoline
(2) 2-amino-4,6-dimethylpyridine

There were obtained the corresponding hydroxybenzyl amine derivatives as listed below:

20 (1) 3-[N-(2-hydroxy-5-methoxybenzyl)amino]-quinoline, m.p. 101-103°C.
(2) 2-[N-(2-hydroxy-5-methoxybenzyl)amino]-4,6-dimethylpyridine m.p. 95-96°C.

25 EXAMPLE 7

Set forth below are some illustrative topical formulations containing a selected active compound of the instant invention.

Formulation Number 1 - Solution

3-(3,5-dichloro-2-hydroxybenzylamino)[1,2,5]

thiadiazole (a) - 2.5%

Distilled water qs to 100%

5 Procedure: Dissolve compound (a) in enough water to make 100%. Filter the solution. Apply to the affected area.

Formulation Number 2 - Tincture

N-(2-hydroxybenzyl)aniline (b) - 2.5%

10 Alcohol U.S.P. - 50%

Water qs to 100%

Procedure: Dissolve compound (b) in the alcohol. Add sufficient water to make 100%. Filter and apply to affected area.

15

Formulation Number 3 - Topical Aerosol

N-(2-hydroxy-5-methoxy-

benzyl)Aniline (c) - 2.5%

Alcohol U.S.P. - 5%

20 Isopropylmyristate - 5%

Conventional halogenated hydrocarbon propellant qs 100% e.g., Freon 11(trichlorofluoromethane), Freon 12(dichlorodifluoromethane), Freon 14 (carbon tetrafluoride), Freon C 318 (Octafluorocyclobutane),

25 Freon 114(Cryofluorane), etc.

Procedure: Dissolve Compound (c) in the alcohol and isopropylmyristate. Add sufficient halogenated propellant and introduce into conventional aerosol containers either by pressure or 30 by cold filing. Apply to affected area.

0081782

- 21 -

16654

Formulation Number 4 - Ointment

4-(2-hydroxy-5-methoxybenzylamino)-3,3-di-
methylbutyrylaminobenzene (d) - 2.5%
Petrolatum U.S.P. qs to 100%

5 Procedure: Heat the petrolatum to 60°C.
Add compound (d) and stir until thoroughly
dispersed. Cool to room temperature. Apply to
affected area.

10

15

20

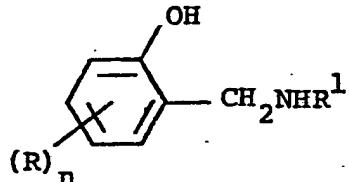

25

30

WHAT IS CLAIMED IS:

1. A compound of structural formula (I)

5

(I)

10 wherein:

- R is (a) fluoro;
- (b) methoxy, ethoxy, n-propoxy or i-propoxy;
- (c) methylthio, ethylthio, n-propylthio or i-propylthio;
- 15 (d) -OCH₂-O;
- (e) -COOH; or
- (f) aryloxy;

R¹ is (a) unsubstituted or substituted phenyl; or
(b) unsubstituted or substituted heteroaryl;

20 n is 1 or 2.

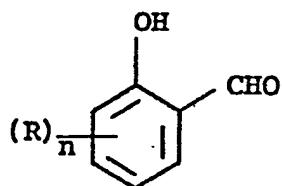

2. The compound of Claim 1 wherein the compound is N-(2-hydroxy-5-methoxybenzyl)aniline.

25 3. A process for the preparation of a compound of structural formula (I) according to Claim 1 comprising:

- (a) treating an appropriately substituted 2-hydroxybenzaldehyde of the
- 30 structural formula II

1

5

(III)

10

with an amine of formula $R^1\text{NH}_2$ to
form a Schiff-base; and

(b) treating the Schiff-base with a
reducing agent.

4. The process of Claim 3 for preparing
15 N-(2-hydroxy-5-methoxybenzyl)aniline.

5. A pharmaceutical composition for
treatment of topical inflammation comprising a
20 pharmaceutical carrier and an effective amount of a
compound of formula (I) according to Claim 1.

6. The pharmaceutical composition of Claim
7 wherein the compound is N-(2-hydroxy-5-methoxy-
25 benzyl)aniline.

CLAIMS FOR AUSTRIA

1. A process for the preparation of a compound of structural formula (I)

5

10

(I)

wherein:

R is (a) fluoro;

(b) methoxy, ethoxy, n-propoxy or i-propoxy;

(c) methylthio, ethylthio, n-propylthio or i-propylthio;

15

(d) -OCH₂-O;

(e) -COOH; or

(f) aryloxy;

R¹ is (a) unsubstituted or substituted phenyl; or

20

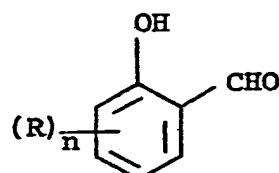

(b) unsubstituted or substituted heteroaryl;

n is 1 or 2

comprising:

25

(a) treating an appropriately substituted 2-hydroxybenzaldehyde of the structural formula II

30

(II)

85

with an amine of formula R¹NH₂ to form a Schiff-base; and

(b) treating the Schiff-base with a reducing agent.
